
django-osm-field

Release 0.2.0

November 10, 2014

1	Installation	3
2	Usage	5
2.1	Model Layer	5
2.2	Form Layer	5
2.3	View Layer	6
2.4	Template Layer	6
3	Credits	9
3.1	Contributors	9
4	History	11
4.1	0.2.0 (2014-11-10)	11
4.2	0.1.4 (2014-06-02)	11
4.3	0.1.3 (2014-05-28)	11
4.4	0.1.0 (2014-05-20)	11
5	References	13
5.1	Fields	13
5.2	Forms	14
5.3	Validators	14
6	Indices and tables	15
	Python Module Index	17

Contents:

Installation

Install **django-osm-field** into your virtual environment or you site-packages using pip:

```
$ pip install django-osm-field
```

To make **django-osm-field** available in your Django project, you first have to add it to the `INSTALLED_APPS` in your `settings.py`. If you are unsure where to put it, just append it:

```
INSTALLED_APPS = (  
    ...  
    'osm_field',  
    ...  
)
```

2.1 Model Layer

You need to add three model fields to your model:

1. `OSMField`
2. `LatitudeField`
3. `LongitudeField`

`django-osm-field` expects them to have a certain name schema: The `OSMField` defines the base name, the `LatitudeField` and `LongitudeField` have the same name appended with `_lat` and `_lon` respectively. See the following example to get an idea:

```
from django.db import models

from osm_field.fields import LatitudeField, LongitudeField, OSMField

class MyModel(models.Model):
    location = OSMField()
    location_lat = LatitudeField()
    location_lon = LongitudeField()
```

It is possible, though, to overwrite the default naming for latitude and longitude fields by giving their names as arguments to the `OSMField`:

```
class MyModel(models.Model):
    location = OSMField(lat_field='latitude', lon_field='longitude')
    latitude = LatitudeField()
    longitude = LongitudeField()
```

2.2 Form Layer

```
from django import forms

from .models import MyModel

class MyModelForm(forms.ModelForm):
```

```
class Meta:
    fields = ('location', 'location_lat', 'location_lon', )
    model = MyModel
```

2.3 View Layer

```
from django.views.generic import CreateView

from .forms import MyModelForm
from .models import MyModel
```

```
class MyCreateView(CreateView):
    form_class = MyModelForm
    model = MyModel
```

2.4 Template Layer

django-osm-field ships with a minimized **jQuery** version. To access it in a template use the `static` templatetag from the `staticfiles` Django app:

```
<script type="text/javascript" src="{% static "js/vendor/jquery-2.1.0.min.js" %}"></script>
```

You can of course load **jQuery** from a CDN as well:

```
<script type="text/javascript" src="//code.jquery.com/jquery-2.1.0.min.js"></script>
```

To get the front-end to work, you also need to include some CSS and JavaScript files. You can do this by simply using `{{ form.media }}` or by adding those lines explicitly:

```
<link href="{% static "css/vendor/leaflet.css" %}" type="text/css" media="screen" rel="stylesheet" />
<link href="{% static "css/osm_field.css" %}" type="text/css" media="screen" rel="stylesheet" />
<script type="text/javascript" src="{% static "js/vendor/leaflet.js" %}"></script>
<script type="text/javascript" src="{% static "js/osm_field.js" %}"></script>
```

In the end your template should look similar to this:

```
{% load static from staticfiles %}<!DOCTYPE HTML>
<html>
  <head>
    <title></title>
    <link rel="stylesheet" href="{% static "css/example.css" %}">
    <!-- Either serve jQuery yourself -->
    <script type="text/javascript" src="{% static "js/vendor/jquery-2.1.0.min.js" %}"></script>
    <!-- or from a CDN -->
    <script type="text/javascript" src="//code.jquery.com/jquery-2.1.0.min.js"></script>
  </head>
  <body>
    {{ form.media }}
    <form action="" method="post">
      {% csrf_token %}
      {{ form.as_p }}
      <input type="submit" value="Save" />
    </form>
```

```
</body>  
</html>
```

Credits

- Markus Holtermann <info@markusholtermann.eu>
- Thomas Schmidt <schmidt@netaction.de>

3.1 Contributors

- Sascha Narr

Project has been started by [Sinnwerkstatt Medienagentur GmbH](#) in April 2014.

4.1 0.2.0 (2014-11-10)

- Added support for Django 1.7 migrations (#2)
- Updated styling (#1)
- Forced map refresh on show
- Added tests
- Changed license from BSD to MIT
- Added support for non-default named form fields (those not ending with `_lat` and `_lon` respectively).
- Added documentation

4.2 0.1.4 (2014-06-02)

- Add minified JavaScript and CSS sources

4.3 0.1.3 (2014-05-28)

- jQuery is not automatically added by the widgets media class anymore

4.4 0.1.0 (2014-05-20)

- First release on PyPI.

5.1 Fields

5.1.1 OSMField

class `osm_field.fields.OSMField(*args, **kwargs)`

Bases: `django.db.models.TextField`

Parameters

- **lat_field** (*str*) – The name of the latitude field. None (and thus standard behavior) by default.
- **lon_field** (*str*) – The name of the longitude field. None (and thus standard behavior) by default.

All *default field options*.

formfield (***kwargs*)

Returns A `CharField` with a `OSMWidget`.

latitude_field_name

The name of the related `LatitudeField`.

longitude_field_name

The name of the related `LongitudeField`.

5.1.2 LatitudeField

class `osm_field.fields.LatitudeField(*args, **kwargs)`

Bases: `django.db.models.FloatField`

All *default field options*.

The `validators` parameter will be appended with `validate_latitude()` if not already present.

formfield (***kwargs*)

Returns A `FloatField` with `max_value` 90 and `min_value` -90.

5.1.3 LongitudeField

`class osm_field.fields.LongitudeField(*args, **kwargs)`
Bases: `django.db.models.FloatField`

All *default field options*.

The `validators` parameter will be appended with `validate_longitude()` if not already present.

`formfield(**kwargs)`

Returns A `FloatField` with `max_value` 180 and `min_value` -180.

5.1.4 Utilities

Location

`class osm_field.fields.Location(lat, lon, text)`

A wrapper class bundling the description of a location (`text`) and its geo coordinates, latitude (`lat`) and longitude (`lon`).

Parameters

- **lat** (*float*) – The latitude
- **lon** (*float*) – The longitude
- **str** – The description

5.2 Forms

5.2.1 OSMWidget

`class osm_field.forms.OSMWidget(lat_field, lon_field, attrs=None)`
Bases: `django.forms.widgets.TextInput`

Adds a OpenStreetMap Leaflet dropdown map to the front-end once the user focuses the form field. See [the usage chapter](#) on how to integrate the CSS and JavaScript code.

5.3 Validators

5.3.1 validate_latitude

`osm_field.fields.validate_latitude(value)`

Validates that the given value does not exceed the range [-90, 90].

Raises Raises a `ValidationError` if `value` is not within the range.

5.3.2 validate_longitude

`osm_field.fields.validate_longitude(value)`

Validates that the given value does not exceed the range [-180, 180].

Raises Raises a `ValidationError` if `value` is not within the range.
